

Technical Due Diligence

Evaluating People, Processes and Technology

Consult Hyperion has long been advising some of the world's largest and most prestigious payment and digital identity companies on technical capabilities and innovation.

The payments and digital identity sectors are currently some of the most active from both an investment and M&A standpoint. Billions of dollars will be spent based on the promise of these companies to deliver a robust technology to support their business vision and growth. Often the success or failure of an investment or acquisition largely rests on the stability and scalability of the underlying technology platforms, people and processes in place at the target company. All of these will need to meet technical and market needs of a dynamic and growing global landscape.

Consult Hyperion's consultants are experts in understanding and evaluating the unique strategic, technical, and operational requirements demanded by the global digital identity and payments sectors.

Our depth and breadth of expertise goes well beyond technology evaluation. We are uniquely positioned to understand global best practises, market needs, regulatory/compliance implications, and evolving data protection laws. We have supported legal counsel for some of the major payment organisations globally, providing expert witness testimony. We understand the technology implications of new laws and regulations.

This combination of market expertise, technology experience and global reach is instrumental to helping support our clients in all aspects of technical due diligence.

We have supported some of the world's largest private equity firms, corporate acquirers, and strategic partners as they evaluate technology as part of an acquisition process. We have developed a proprietary process for providing deep technical due diligence with a specialization in the areas of payments and digital identity.

Our tested and established process examines all areas of an organization's technical, organizational, and operational infrastructure, with a keen understanding of the regulatory and market requirements that uniquely impact the payment and digital identity industries. Throughout the entire process, we ensure the investing or acquiring company's investment objectives are continually evaluated and considered.

Our analysis can include, but is not limited to the following:

- Product Strategy and Portfolio
- Roadmap and Change Management
- People and Organization
- Software Architecture
- Technology Infrastructure
- Product Security and Data Protection
- Enterprise Security and Risk Management
- Development and Operational Processes and Practises
- Analysis of Open-Source Technologies
- Source Code Review
- Customer Support and Services
- Vendor and Third-Party Management

We design a custom and thorough plan to ensure the most thorough level of due diligence is completed across the entire organization, from senior executives to technical and operational staff. Providing a complete and independent view of the risks and opportunities is critical to consider both before and after the potential investment.
